

INSIGHT

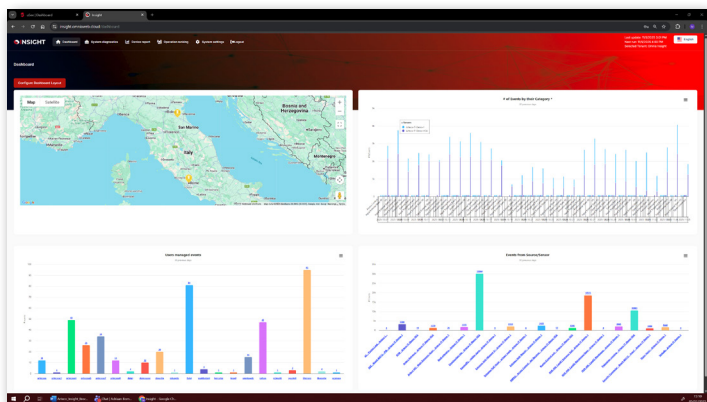

Wherever your security system is installed, its correct functioning is an integral part of security itself.

Insight was conceived by Arteco as a **Business Intelligence platform**, an effective tool for security managers and maintenance staff to better understand the status of systems, devices, and operator performance.

Insight allows you to **manage and monitor** hundreds of systems in one single platform.

It is available in English, Italian, Spanish, and Portuguese, hosted on Amazon AWS, and accessible via any device.

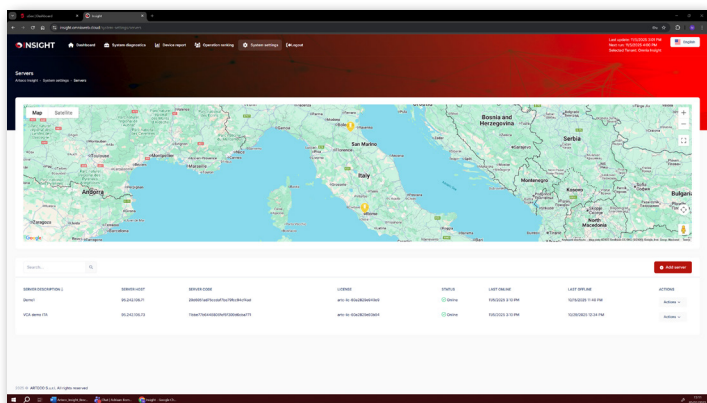

Cloud-based, multi-tenant, and highly scalable.

DASHBOARD & REPORTS

Insight features a fully customizable homepage. Choose your preferred charts and visualize data from the last 7, 14, or 30 days for flexible analysis. All dashboards are designed for simplicity and efficiency, providing quick overviews or detailed insights into events and system trends.

Data export is advanced, as Insight supports many file extensions for detailed reporting, quick sharing, or external analysis.

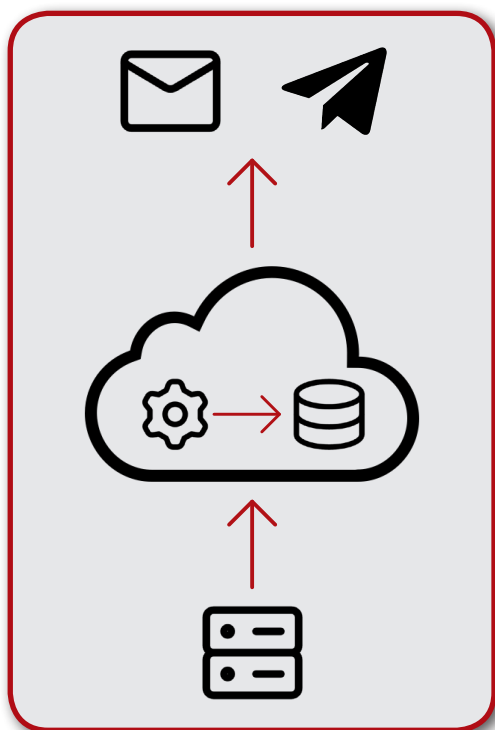

INSIGHT MAP

Insight comes with full Google Maps integration.

You can now visualize the geographic location of all connected servers.

This feature helps operators and system administrators immediately locate issues or offline devices across multiple sites.

SMART NOTIFICATIONS

Get alerts only when something relevant happens!

Insight's notification engine provides more control and adaptability.

Users can create up to 20 notification rules per tenant and receive alerts through multiple channels simultaneously: email and Telegram.

Notifications can be configured by event frequency, persistence, keywords (e.g. names, license plates or specific object classes) and when a system event is restored (e.g. when a gateway server comes back online).

EVENT CATEGORIES

Insight monitors, organizes, and analyzes events in three main categories:

- **SYSTEM DIAGNOSTICS** Detects and analyzes system malfunctions such as offline servers, camera disconnections, or hard-drive failures. Insight not only counts these events but also measures their duration, helping you understand system reliability.
- **DEVICE REPORT** Collects and classifies events generated by connected devices such as VCA analytics, license plate recognition, or intrusions. You can easily identify event peaks, false alarms, and performance variations over time.
- **OPERATION RANKING** Evaluates operator efficiency by analyzing how events are managed and resolved. It's a key tool for optimizing workloads and improving response time.

MODERN, CUSTOMIZABLE, AND CONNECTED

Insight is not just a monitoring tool.

It is an intelligent ecosystem for data-driven security management.

With customizable dashboards, integrated maps, advanced export options, and multi-channel notifications, Insight adapts to your workflow and scales with your infrastructure.

Wherever your security runs, Insight keeps you in control.
