

FEATURE:

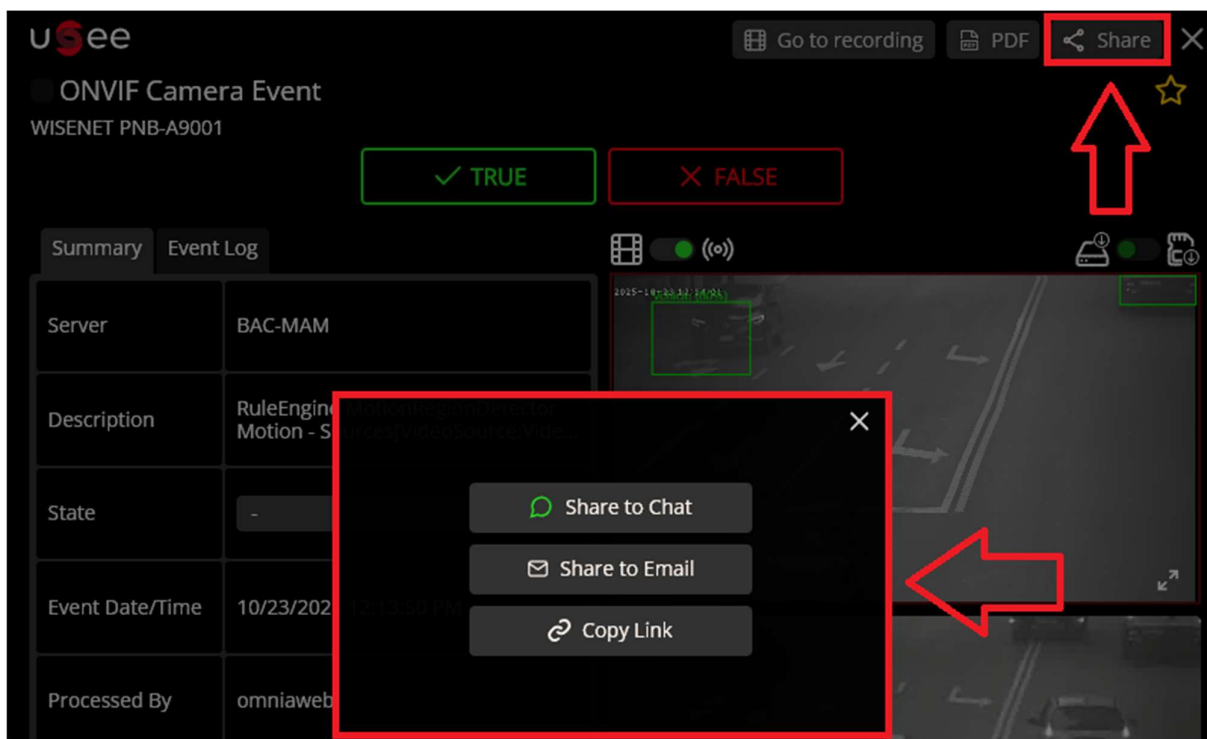

Recording environment:

Improved Timeline Navigation

You can now scroll freely before and after the time you searched for. The timeline will automatically extend to show everything around your results, making it easier to see what happened before and after the event—without running multiple searches.

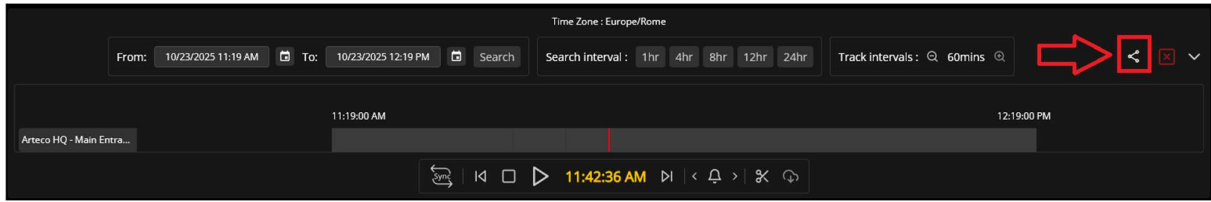

Share Events Easily

You can now share any event from uSee with a simple link. Send it via chat, email, or copy it wherever you like. When someone opens the link, uSee will take them straight to the event—if they have permission to view it.

Share Recording Searches

You can now share your recording searches, including the cameras, time range, and playback moment you selected. Share via chat, email, or by copying a link.

Smoother Login Experience

After logging in, you'll now be taken directly to the page you were trying to visit—no extra steps needed.

Omnia Web Updates

Camera metadata will no longer appear in live view in Omnia Web (uSee Lite for on-prem servers).

Reordering cameras and layouts has also been removed in Omnia Web (uSee Lite for on-prem servers).

BUGFIX:

- Fixed an issue where some users couldn't access server event notification settings, even if they had the right permissions.
