

**Feature:**

**Reorder of User Settings Section**

The User Settings sections have been reorganized to make them more intuitive. Some section names have also been updated to better reflect their purpose.

## Live view: Optimize for stability

Users with unstable bandwidth can now force uSee to use **MSE/MMS** instead of **WebRTC** for live viewing.

When using MSE/MMS, the following features are **not available**:

- Audio
- Live metadata bounding boxes
- Multiple resolutions

Enabling this option will automatically disable:

- Adjust stream automatically
- Adaptive resolution
- Live metadata

The new switch can be found in **User Settings → Live View**.
